PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/632,343	Applicant(s) LETTS ET AL.	
	Examiner John Cooney	Art Unit 1796	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 21 April 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,30-40 and 42-69 is/are pending in the application.
- 4a) Of the above claim(s) 43-45,48-50,55-63 and 69 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,30-40,42,46,47,51-54 and 64-68 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Applicant's arguments filed 4-21-08 have been fully considered but they are not persuasive.

Election/Restrictions

Newly submitted claims 43-45, 48-50, 55-63, and 69 are directed to an invention that is independent or distinct from the invention originally claimed for the following reasons: The new claims 43-45, 48-50, 55-63, and 69 are directed towards a method for forming laminates involving operations independent and/or distinct from the methods for mixing and releasing reactants originally presented.

Since applicant has received an action on the merits for the originally presented invention, this invention has been constructively elected by original presentation for prosecution on the merits. Accordingly, claims 43-45, 48-50, 55-63, and 69 are withdrawn from consideration as being directed to a non-elected invention. See 37 CFR 1.142(b) and MPEP § 821.03.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1, and 30-40, 42, 46, 47, 51-54, and 64-68 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Applicants' employment of the language that "the amount of nitrogen added...is an amount sufficient to..." in the methods of their claims is confusing as to intent because it is evident that other conditions such as pressure and temperature must necessarily be controlled in order to establish the conditions of the claims and the metes and bounds of applicants' claims can not be definitively determined. The metes and bounds of applicants' claims can not be definitively determined, because other criteria such as pressure and temperature need to be identified by the claims in order that the qualitative effects identified by the claims can have a definitive and determinable meaning from the standpoint of 35 USC 112 2nd paragraph.

Applicants' arguments have been considered. However, rejection is maintained. The instant case differs from the situation from *In re Spiller* in that it is not the use of "in an amount sufficient to" in and of itself that is objectionable. Rather, determination of the amounts of claimed gases included or excluded by the metes and bounds of the claims can not be made because other factors having as much or more of an impact on the expansion of the released mixture are not accounted for. These factors include, among other factors, pressure, temperature, and other blowing agent gases. It can not be determined what, if any, limitation to the amount of air being added to the claims. Rather, if anything, the limitation is an invitation to experiment to determine what combinations of pressures, temperatures, amounts of blowing gases, and other factors, along with amounts of the claim specified gases are sufficient to cause the expansions defined by the claims. Additionally, the pressure and temperature conditions added to

Art Unit: 1796

the claims do not remedy the above indicated problems because the conditions of release, such as ambient conditions, are not accounted for and/or identified by the claims nor are the problems associated with the impact of other blowing gases accounted for by the language of the claims.

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 39, 52-54, and 64-68 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Applicants' supporting disclosure does not provide support for the claim defined methods being operated using temperatures at the mixhead as now claimed under pressure conditions as claimed. This is a new matter rejection.

The ranges of temperatures recited in the claims as they currently stand refer to the temperatures of the B-side prior to mixing with the A-side. Claims 39 and 64 need to be amended to recite the temperatures from page 12 lines 1-2 of the supporting disclosure in order to be coordinated with the invention originally disclosed.

Claims 64 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Applicants' recitation of "inert gas" without "low boiling" and "having a boiling point of less than 20 degrees Celsius">{note here also: rejection bridging page 2 and 3 of the Office action mailed 4-8-05 wherein accompanying boiling point endpoint is required to give "low" relevance as a term of degree} sets forth a range of included gases such that it is not evident that applicants, at the time the application was filed, had possession of the invention now claimed. This is a new matter rejection.

Claim 64 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The term "inert" in claim 64 is a relative term which renders the claim indefinite. The term "inert" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. "Inert" without recitation in the claims what the gases are inert to renders the claim confusing as to intent.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, and 30, 31, 34-36, 46, and 51-54 are rejected under 35 U.S.C. 102(b) as being anticipated by Raynor et al.(3,882,052).

Raynor et al. discloses preparations of isocyanate-based rigid foams prepared by contacting streams of isocyanate component and a polyol component wherein contacting takes place in the presence of blowing agent and inert gas, including nitrogen and air, to enhance the foaming action in amounts and to degrees sufficient to meet the requirements of applicants' claims (see the entire document). Further, Raynor et al. discloses room conditions or moderate heat which meet the temperature conditions of the claims.

As Raynor et al. provides for amounts of isocyanate being used in excess of isocyanate reactive component (see column 3 lines 13-17) difference based on applicants' recitation of "isocyanurate" in the preamble is not seen. This recitation in the preamble only requires that one isocyanurate linkage be present, and Raynor et al.'s disclosure of index values which provide for such linkages meets this requirement of the claims.

As to the amounts of inert gas required to meet the limitations of applicants' claims, Raynor et al. (see column 4 lines 15-32) provides for specific inclusion of these gases (column 4 line 5) in the embodiments of its disclosure. It is seen these amounts provided in the compositions of Raynor et al. and expelled under the pressure conditions of Raynor et al. would inherently result in the methods having inert gas contained in the compositions to be expelled that would inherently possess the dissolved gas concentration values of applicants' claims and inherently exhibit the expansion effects defined by applicants' claims upon expulsion from the mixer. Difference is not seen between the amounts of gas disclosed and provided for by the teachings of Raynor et al. and those of applicants' claims based on the current evidence of record.

Applicants' arguments have been considered. However, rejection is maintained. It is maintained that the amounts of gas provided by Raynor et al. are sufficient to meet the amounts of gas provided for by the limitations of applicants' claims (as best as can be determined given the issues set forth in the rejections under 35 USC 112 set forth above). The claims require amounts of the gas that are "sufficient to increase the volume of developing foam as it instantaneously leaves the mixhead by at least 1.25". It is held and maintained that Raynor et al. (column 4 lines 15-32) provides amounts which would be sufficient to impart this effect in systems under appropriate conditions. It is maintained that the ranges of amount values defined by the claims are inherent to the teachings of Raynor et al.

Additionally, though it is maintained that applicants' claim limitation mentioned above only pertains to amounts of gas employed, it is noted that though Raynor et al. desires no substantial pre-expansion (column 5 lines 50-65), it does not fully exclude some pre-expansion and through its language "no substantial pre-expansion", and, further, the disclosure of Raynor et al. indicates that "the foaming reaction commences practically as soon as the mixture is deposited" which encompasses the conditions defined by the claims.

Claims 34 and 51 are rejected under 35 U.S.C. 102(b) as being anticipated by Wishneski et al.(5,264,464).

Wishneski et al. discloses preparations of isocyanate-based rigid foams prepared by contacting streams of isocyanate component and a polyol component wherein contacting takes place in the presence of blowing agent and nitrogen gas to enhance the foaming action in amounts and to degrees sufficient to meet the requirements of applicants' claims (see the entire document).

As Wishneski et al. provides for amounts of isocyanate being used in excess of isocyanate reactive component (see column 3 lines 12-14) difference based on applicants' recitation of "isocyanurate" in the preamble is not seen. This recitation in the preamble only requires that one isocyanurate linkage be present, and Wishneski et al.'s disclosure of index values which provide for such linkages meets this requirement of the claims.

As to the amounts of nitrogen required to meet the limitations of applicants' claims, Wishneski et al.(see column 7 lines 16-41) provides for specific inclusion of nitrogen in the embodiments of its disclosure. It is seen these amounts provided in the compositions of Wishneski et al. and expelled under the pressure conditions of Wishneski et al. would inherently result in the methods having nitrogen contained in the compositions to be expelled that would inherently possess the dissolved nitrogen concentration values of applicants' claims and inherently exhibit the expansion effects defined by applicants' claims upon expulsion from the mixer. Difference is not seen between the amounts of nitrogen disclosed and provided for by the teachings of Wishneski et al. and those of applicants' claims based on the current evidence of record.

Applicants' arguments have been considered. However, rejection is maintained. It is maintained that the amounts of gas provided by Wishneski et al. are sufficient to meet the amounts of gas provided for by the limitations of applicants' claims (as best as can be determined given the issues set forth in the rejections under 35 USC 112 set forth above). The claims require amounts of the gas that are "sufficient to increase the volume of developing foam as it instantaneously leaves the mixhead by at least 1.25". It is held and maintained that Wishneski et al. provides amounts which would be sufficient to impart this effect in systems under appropriate conditions, including the accompanying employment of the blowing/frothing agent disclosed in Wishneski et al. It

is maintained that the ranges of amount values defined by the claims are inherent to the teachings of Wishneski et al.

Further, as to applicants' arguments specific to Wishneski et al at column 7 lines 37-41, it is held that it is clear from Wishneski et al. (see abstract, column 1 lines 25-42) that it is the need for an auxiliary CFC foaming agent is the result which is being avoided. Wishneski et al. is clear in its employment of frothing agents and formation of frothed foams (column 1 line 37-55 and column 8 line 36). Distinction based on this feature is not evident.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 32, 33, 37-40, 42, 47, and 64-68 are rejected under 35 U.S.C. 103(a) as being unpatentable over Raynor et al. as applied to claim 1, and 30, 31, 34-36, 46, and 51-54 above, alone, and further in view of Volkert et al.(5,278,195)..

Raynor et al. differs from the claims in that the higher pressures as now claimed are not specifically required. However, Raynor et al. identifies the use of elevated pressures (column 5 lines 44-50) in practice of its mixing operations for purposes of preventing backflow of materials. Accordingly, it would have been obvious for one

Art Unit: 1796

having ordinary skill in the art to have operated under higher pressures allowed for in the practice of the teachings of Raynor et al. for the purpose of maximizing backflow reducing effects within the teachings of Raynor et al. in order to arrive at the processes of applicants' claims with the expectation of success in the absence of a showing of new or unexpected results. It has long been held that where the general conditions of the claims are disclosed in the prior art, discovering the optimal or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233; *In re Reese* 129 USPQ 402. Similarly, it has been held that discovering the optimum value of a result effective variable involves only routine skill in the art. *In re Boesch*, 617 F.2d 272,205 USPQ 215 (CCPA 1980). Additionally, it is not seen that instantaneous expansion/release of pressure on systems held under high pressure is an unexpected effect arising from high pressure processing conditions.

Raynor et al. differs from the claims in that it does not require alkane blowing agents, additionally or to the exclusion of haloalkanes, as claimed. However, Volkert et al. discloses alkanes (see column 10 lines 42-46) for their foaming effect in related isocyanate based formulations. Accordingly, it would have been obvious for one having ordinary skill in the art to have employed the alkanes disclosed by Volkert et al. within the teachings of Raynor et al. for the purpose of providing acceptable foam forming effects in order to arrive at the processes of applicants' claims with the expectation of success in the absence of a showing of new or unexpected results.

Claims 1 and 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wishneski et al. as applied to claim 34 and 51 above, and further in view of Raynor et al.(3,882,052) and Volkert et al.(5,278,195)..

Wishneski et al. differs from the claims in that it does not require its nucleating gas to be air. However, Raynor et al. discloses air and nitrogen to be substitutable inert nucleating gases in urethane based foam preparations (see column 4 lines 2-5) for their nucleating effect. Accordingly, it would have been obvious for one having ordinary skill in the art to have employed the air disclosed by Raynor et al. as the nucleating gas in the preparations of Wishneski et al. for the purpose of providing acceptable foam forming effects in order to arrive at the processes of applicants' claims with the expectation of success in the absence of a showing of new or unexpected results. It is prima facie obvious to substitute equivalents, motivated by the reasonable expectation that the respective species will behave in a comparable manner or give comparable results in comparable circumstances. *In re Ruff* 118 USPQ 343; *In re Jezel* 158 USPQ 99; the express suggestion to substitute one equivalent for another need not be present to render the substitution obvious. *In re Font*, 213 USPQ 532.

Wishneski et al. differs from the claims in that it does not require alkane blowing agents. However, Volkert et al. discloses alkanes (see column 10 lines 42-46) for their foaming effect in related isocyanate based formulations. Accordingly, it would have been obvious for one having ordinary skill in the art to have employed the alkanes disclosed by Volkert et al. within the teachings of Wishneski et al. for the purpose of providing acceptable foam forming effects in order to arrive at the processes of

Art Unit: 1796

applicants' claims with the expectation of success in the absence of a showing of new or unexpected results.

Rejections under 35 USC 103 are maintained as set forth above. Applicants have not made separate arguments regarding these rejections. Therefore, no further comments are seen due.

The following previous arguments are maintained to be relevant to the above rejections (additions in brackets):

Applicants' arguments on appeal have been considered in light of the above rejections. However, it should be noted that the non-frothing mixtures as provided for by the prior art have not been distinguished from the claims based on the recited amount values currently claimed. The recitation of expansion "instantaneously" upon exit from the mixhead does not differentiate the claims from the expansion effected by the prior art upon release in the patentable sense because specific qualitative conditions of the immediate expansion have not been established in the claims.

"Instantaneously", without further defining meaning being set forth in the claims does not differentiate the claims over the expansion upon exit from the mixers provided for by the prior art.

The claims do not provide clear and distinctive differences to be evident based on the amounts of nitrogen [inert gas] added and/or dissolved sufficient to distinguish over the amounts of nitrogen [inert gas] disclosed and/or provided for by the teachings of the prior art.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP

§ 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37

CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to John Cooney whose telephone number is 571-272-1070. The examiner can normally be reached on M-F from 9 to 6.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, James Seidleck, can be reached on 571-272-1078. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
